Web services - What's new in ShipIT version 3.3

In this document you will find an overview of the adjustments to the web services for ShipIT version 3.3. Please refer to the web services documentation for corresponding information.

- In the request for the search of a ParcelShop based on an address, the parameter "distance" can now optionally be specified (maximum 50 km). If the parameter is not specified, the default value of 50 km is used.

- For data protection reasons, the contact information of the ParcelShops (fax number, telephone number, e-mail address) was removed from the responses of the ParcelShop searches.

- The maximum length of telephone numbers has been limited to 35 characters. A longer entry is automatically shortened when it is saved in the database.

- Using the method "updateParcelWeight" it is possible to update the parcel weight. Until now, the updated weight was not transmitted to GLS. This has been changed. All changes >0.2 kg are transmitted to GLS.

- The following updates and optimisations were made to the **web services documentation**:

  o Corrections in the example requests

  o Correction in the method "getParcelShopsInDistance": POST instead of GET

  o Added example for Mondial Relay (GLS France)
